

Accessibility Audit

Name: Amanda Clark

Class Project: Accessibility Audit

Website:

Date: February 2, 2026

Greetings,

I am a Master's student currently enrolled in a Web Content Management course. I am learning about how to help entities like school districts, libraries, and government agencies comply with digital accessibility laws like Sections 504 and 508 of the Rehabilitation Act, as well as Title II of the Americans with Disabilities Act to better serve students, patrons, and other community members with disabilities.

The report below is modeled after the web accessibility checks made available by W3C WAI at [this link](#). The tools used to perform this initial review are the [WAVE](#) and [ANDI](#) testing applications provided by WebAIM and the U.S. Social Security Administration, respectively. It is my sincere hope that you find this evaluation report informative and that you consider implementing some of the recommended changes.

The specific pages evaluated include:

- <https://laketravislibrary.org>
- <https://laketravislibrary.org/calendar/>
- <https://laketravislibrary.org/tech-coach/>
- <https://laketravislibrary.org/meeting-room/>

Accessibility Checklist

Part I - Common Checks

a. Image Alternative Text

"Image alternative text ("alt text") is a short description that conveys the purpose of an image. Alternative text is used by people who do not see the image" (World Wide Web Consortium, 2026).

Assessment of Image Alternative Text: **Needs Improvement**

Each of the pages assessed contained images that were either missing alternative text or contained repetitive adjacent link text, which can cause redundancy when using screen readers that may be confusing or a waste of time. The images of concern include the LTCL logo graphic and the YouTube social media icon. People who are unable to see these images will either be left without the full context of the image or will hear the same information twice, making their experience of the website less precise and therefore unequal to users who can see the images.

b. Page Title

"Page titles are shown in the window title bar or tab in browsers. They are the first thing read by screen readers and help people know where they are" (World Wide Web Consortium, 2026).

Assessment of Page Title: **Good**

All the pages assessed had distinct and unambiguous titles. The pages also had “Lake Travis Community Library” after the page designation, which helps users maintain site orientation.

c. Headings

“Headings communicate the organization of the content on the page, like a table of contents. Screen reader users often use page headings as a way to navigate a web page” (World Wide Web Consortium, 2026).

Assessment of Headings: Needs Improvement

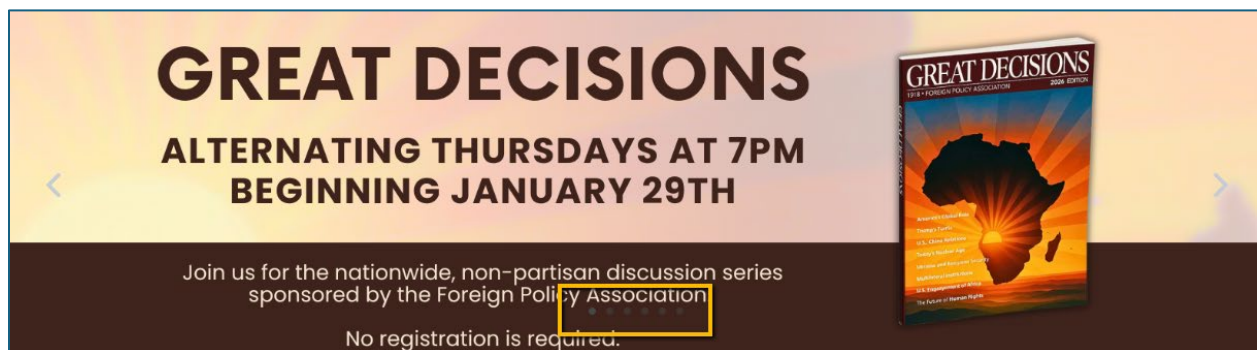

While three of the pages assessed contained proper headings, the [Home](#) page contains skipped heading levels and empty heading elements. There are two inactive headings without any content that seem to be used for spacing. This broken hierarchy can cause confusion when using screen readers and navigating the Recent News and Upcoming Events sections.

d. Color Contrast

“Color contrast refers to the difference between adjacent colors. Typically this is the text and background color. It also includes interactive elements and their background, and parts of graphs or charts. Some people cannot read text or find elements if there is insufficient contrast between colors” (World Wide Web Consortium, 2026).

Assessment of Color Contrast: Needs Improvement

Each of the pages assessed contained a contrast errors that can make it difficult for users with low vision to decipher text and navigation tools. The industry standards of 4.5:1 for smaller text and 3:1 for larger text (greater than 18 point or 14 point bold) are in need of adjustment. The contrast ratio for the Search box in the upper right hand corner is 1.91:1. The contrast ratio for the carousel dots within the image carousel on the [Home](#) page varies depending on the background image. For instance, the image advertising the Great Decisions discussion group pictured below has a brownish background (#3E231C) and the carousel dots are similarly in color (#433532 and #474747). The contrast ratios for these are 1.22:1 and 1.54:1, respectively.

e. Skip Link

“A skip link is the first interactive element on a page. People using keyboards, screen readers and other assistive technologies can use skip links to quickly and easily reach the main page content” (World Wide Web Consortium, 2026).

Assessment of Skip Link: Needs Improvement

None of the pages assessed contained a skip link. The ability to bypass blocks of content that are typically repeated on multiple pages within a site helps to streamline the navigation experience for users with certain disabilities.

f. Visible Keyboard Focus

“Keyboard focus is a visible indicator that identifies the element with focus and moves as you tab through a page. For people who rely on a keyboard to navigate it is important that they know which link or form control has focus” (World Wide Web Consortium, 2026).

Assessment of Visible Keyboard Focus: Needs Improvement

None of the pages assessed are accessible via visible keyboard focus. The ability to use the keyboard or voice assistive technologies to navigate a site with keyboard focus is essential for individuals who cannot use a mouse. Mobility, vision, and cognitive impairments like hand tremors, paralysis, and low vision can make it difficult or impossible to utilize a mouse for navigation.

g. Language of Page

“Web pages should identify the primary language of the page. Specifying the language of the page means that assistive technology that speaks content can correctly pronounce words” (World Wide Web Consortium, 2026).

Assessment of Language of Page: Good

All of the pages assessed indicate the primary language of the page. Additionally, it is especially helpful that the language is identified as “en-US.” This is beneficial for assistive software in providing precise interpretation of American English in terms of conveying spelling, formatting, and nuance.

h. Zoom

“Zoom is used to enlarge the text and images on web pages to make them more readable. Some people need to enlarge content in order to read it. When content is zoomed it still needs to be legible and usable” (World Wide Web Consortium, 2026).

Assessment of Zoom: Good

All of the pages assessed appear to have been coded with zoom accessibility in mind. The site was still legible when zooming in past 200% and shrinking the screen to a narrow viewport. All text was wrapped in the visible area, and no text was lost behind images or other text.

Part II - Audio/Visual Checks

a. Captions

“Captions are a text version of the speech and non-speech audio information needed to understand the video and displayed with the video. The audio in video content needs to be available to people who are Deaf or hard of hearing” (World Wide Web Consortium, 2026).

Assessment of Captions: Not Applicable

None of the pages assessed contained videos. Any videos used on other pages within the site should utilize captions to ensure accessibility.

b. Transcripts

“Transcripts are a text version of the speech and non-speech information in audio content and available separately from the video. They are used by people who are Deaf, hard of hearing or who have difficulty processing audio information” (World Wide Web Consortium, 2026).

Assessment of Transcripts: Not Applicable

None of the pages assessed contained audio or video. Any audio or videos containing audio on other pages within the site should utilize transcripts to ensure accessibility.

c. Audio Description

“Audio description describes visual information needed to understand the content, including text displayed in the video, as part of the video. It provides content to people who are blind and others who cannot see the video adequately” (World Wide Web Consortium, 2026).

Assessment of Audio Description: Not Applicable

None of the pages assessed contained audio elements in need of description. Any audio on other pages within the site should utilize description to ensure accessibility.

Part III - Form Checks

a. Labels

“Form field labels are the text beside form fields. They should tell us what information to enter or what checkbox to select. Everyone needs labels to understand how to interact with a form” (World Wide Web Consortium, 2026).

Assessment of Labels: Needs Improvement

The same labeling issues are present on each of the four pages assessed. Within the header, there is a <div> element that is not displayed that is the root of the form field labels needing some adjustment. The reuse of the “id” attribute values attached to the search box results in missing form label and multiple form label errors. The values “searchform,” “button_catalog,” and “button_site” are all reused in a way that can cause confusion for users of accessibility tools. Additionally, there is a search box that is not labeled within the <iframe> element on the [Calendar](#) page. Correcting these minor errors will improve access to essential site information.

b. Required Fields

“A required form field must be completed before you submit a form. Marking which fields are required in a form makes it easier for everyone to complete forms” (World Wide Web Consortium, 2026).

Assessment of Required Fields: Not Applicable

None of the pages assessed contained required form fields. In addition to being flagged as required in the HTML code, any required form fields on other pages within the site should include the word

“required” in the label even if an asterisk is present. This helps individuals with low vision and those utilizing screen readers navigate the form.

Summary

I appreciate your time and attention and would like to thank you for any future consideration of the implementation of the above adjustments. There were a moderate number of accessibility issues found but many accessibility issues are relatively easy and quick to fix. With a minimal amount of attention, the Lake Travis Community Library’s website will be accessible for all users, regardless of their physical abilities and technological needs. More information about comprehensive website accessibility assessment can be found at this [W3C WAI site](#).
